Dr. Se-Yeun Lee joins the CIG team

The Climate Impacts Group is pleased to welcome Dr. Se-Yeun Lee to her new position as CIG Research Scientist specializing in hydrology. Se-Yeun has a long history with the Climate Impacts Group: she previously worked with Alan Hamlet on the Columbia Basin Streamflow Scenarios Project, and on the study of flood mitigation options for the Skagit River under climate change with the Skagit Climate Science Consortium. Se-Yeun has also collaborated extensively with Josh Lawler, Alan Hamlet, Maureen Ryan and others to investigate the implications of climate change for NW wetland systems. Se-Yeun will be working with CIG and collaborators to identify and capitalize on opportunities for scientific research and product development that advance the knowledge and practice relevant to climate resilience, with particular attention to assessment and modeling of hydrologic and water resources-related consequences of climate change.
